P2085 Lot No. PR10018

Cynomolgus Monkey Liver Microsomes
Pyrazole-treated, Male, Pool of 3
0.5 mL at 10 mg protein / mL
Suspension medium: 250 mM sucrose

Specific content and activities [a]		Content / Rate
Cytochrome P450	(nmol/mg protein)	1.174
Cytochrome b_5	(nmol/mg protein)	0.284
NADPH-cytochrome *c* reductase	(nmol/mg protein/min)	113 ± 6
4-Nitrophenol hydroxylation	(nmol/mg protein/min) [a]	2.27 ± 0.12

[a] Fold induction: ~5-fold increase over control microsomes

Background: Treatment of male monkeys with Pyrazole causes a >5-fold induction of liver microsomal CYP2E levels, which is associated with an increase in 4-nitrophenol hydroxylation.

Animal Information

Species:	Monkey	Treatment:	Pyrazole
Strain:	Cynomolgus	Supplier:	Sigma (Cat. No. P56607)
Sex:	Male	Vehicle:	Saline
Age:	Sexually mature	Concentration:	20 mg/mL
Vendor:	WIL Research	Regimen:	200 mg/kg body weight once per day on days 1-4, tissue harvested on day 5.

Monkeys were housed in an AAALAC-accredited facility

Imported animals were quarantined for one month prior to shipment into the United States to reduce the risk of importing Ebola virus-infected monkeys. All animals were under veterinary care and were asymptomatic at the time of euthanasia. All of the monkeys tested negative for Simian Retrovirus. None of the animals examined tested positive for any other infectious agents.

Store at -80 °C

CAUTION: This sample should be considered as a potential biohazard and universal precautions should be followed. Intended for in vitro *use only.*
